

Who Has What — Modutecture vs StatusNeo vs Jeeth's Proposal

Honest grounding (read before the meeting). Modutecture already has the digital twin, the Moducules, the reusable catalog, the rules pipeline, and the Unity experience. Do **not** pitch "we propose the twin" — their own onboarding doc and website say they have it. What is genuinely net-new is the layer their docs show **zero** of: a governed **agentic AI** layer, an **inline deterministic correctness gate**, a **knowledge graph / GraphRAG**, and **BIM federation**. That corrected story is stronger, not weaker — it shows you read their system and target real gaps.

Sources: Modutecture website (modutecture.com) + the Team Onboarding Document (esp. §1-2 scope, §18 System Architecture). Absences below were verified by search of the onboarding doc.

Column 1 — What MODUTECHTURE already has (theirs; do not claim)

Capability	Evidence
Digital twins of rooms + their contents, as the single source of truth	onboarding: "integrated with digital twins of rooms and their contents"; website: "we deliver digital twins, the single source of truth"
Moducules — modular, <i>rule-bearing</i> ("predefined rules and behaviors"), reusable lego-blocks	onboarding Project Overview
Base Moducules (Get/Create) — the reusable-template catalog	onboarding §18 API layer

Capability	Evidence
Space Bot / Designer, Room Builder / Room Planner, Catalog	onboarding §1-2
Unity 3D Experience Layer as the main user-facing runtime	onboarding §18
ASP/SPA rules pipeline — Applicable Standards + Space Programming ingestion, validation, dedup, rollback (Databricks)	onboarding §2C, §18
GraphQL + REST API layer	onboarding §18
SQL Server/SSMS + Lakebase/Postgres storage	onboarding §18
Multitenant AAA, CI/CD, QA automation (Cucumber/Selenium/RestAssured/AltTester, Azure DevOps)	onboarding §2D-E, §17
Contextual intelligence · lifecycle two-way data flow · operational performance data · vendor-neutral	website
Implication: the twin, Moducules, reusable catalog, standards pipeline, and Unity experience are <i>the platform you are joining</i> — not things to propose. Speak about them as "your twin," "your Base Moducules," etc.	

Column 2 — What the STATUSNEO pod is currently delivering (the engagement)

Per the onboarding doc, the pod's present mandate is **product + platform engineering**, not AI:

- Product/UX workflows: Room Builder/Planner/Catalog, Space Bot navigation & UI modernization
- UI platform / component library (stepper, dimension controls, reusable foundations)
- Data engineering: ASP/SPA pipeline reliability, Excel→JSON, Base Moducule extraction
- Backend/API + security: GraphQL capabilities, multitenant row-level filtering, **GraphQL → Lakebase/Postgres migration + query parity**
- Continuous QA automation + Azure DevOps traceability

Implication: StatusNeo is trusted to build and harden *their* product. The agentic-AI mandate is **not yet** in scope — which is the opening for your role.

Column 3 — What JEETH proposes to ADD / EXTEND (the net-new thesis)

Framed as building **on** their twin, never replacing it. Verified absent from the onboarding doc.

Proposed addition	Why it's net-new	Honesty flag
Agentic AI layer — LangGraph orchestration + MCP tools + reflective agents; turn "Space Bot" from a designer UI into a <i>governed AI copilot</i>	onboarding shows no LLM/agentic/GenAI anywhere; this is StatusNeo's core DNA	Clearest win. Lead with this.
Inline deterministic gate — correct-by-construction validation at <i>placement time</i> , not only batch	they validate standards in a batch Databricks pipeline (ASP/SPA); inline design-time gating is additive	Confirm: is validation inline today or batch?
Knowledge graph + GraphRAG (Neo4j) — relationships, blast-radius, AI grounding	stack is SQL Server + Lakebase + Databricks; no graph DB / RAG	additive modeling + grounding layer
Event-sourced truth + renderer-independence — twin owns truth; Unity becomes a thin client ("the GPU")	depends on how much truth lives in Unity's scene today	Confirm: where does truth live — data layer or Unity scene?
BIM federation — Revit/APS (GraphQL), IFC (ISO 16739), BCF round-trip	onboarding shows no BIM/Revit/IFC/BCF	extends "vendor-neutral" to formal BIM interop
Custom/local LLM + LoRA flywheel — domain-tuned model as a moat	no model layer in docs	roadmap moat
Safety invariant — "the LLM proposes, the deterministic gate disposes"	makes agentic AI safe for healthcare	the governance spine

What the demo is: a reference implementation / demonstrator of this proposed layer — the agentic + gate + graph architecture, running in miniature over a faithful slice of their domain (headwall / bed / sink / med-gas). It is **not** a claim that they lack a twin. Say so plainly: *"This is a working model of the AI + correctness layer I'd add to your platform."*

The corrected one-liners (use these in the room)

- ✗ "We propose the twin as the core."
 - ✓ "You've built the twin and the contextual-intelligence platform. I'm proposing the layer your roadmap doesn't show yet: a *governed agentic-AI* layer and an *inline correctness gate* that make the twin reason and stay correct-by-construction — and I built a working model of it to show exactly how."
 - ✓ "Your Base Moducules are the reusable catalog; I'd add the agent that *composes* from them and the gate that *validates* every placement inline."
 - ✓ "Revit owns geometry, your twin owns the rules and reasoning — I'd federate them via IFC/BCF so the intelligence flows back into the architect's tool."
-

Questions to confirm in the room (humility = credibility)

Asking these *first* de-risks the proposal and proves you think in terms of **their** system:

1. **Validation:** today, are Applicable-Standards/rules enforced **inline at design time**, or as a **batch** ASP/SPA pipeline? (Determines how additive the inline gate is.)
2. **Truth ownership:** does the twin's authoritative state live in the **data layer** (SQL/Lakebase), or partly in **Unity's scene graph**? (Determines the renderer-independence work.)
3. **AI today:** is there any **LLM/agentic** capability in Space Bot now, or is it a designer/navigation UI? (Confirms the agentic layer is net-new.)

4. **BIM:** how do you exchange **BIM/Revit/IFC** today, if at all? (Sizes the federation work.)
5. **Graph:** is there appetite for a **knowledge-graph / GraphRAG** layer alongside the relational store, for relationships + AI grounding?

Lead with curiosity about their system; *then* show the demo as "here's the layer I'd add."
That sequence — their platform first, your addition second — is what reads as senior.
