

PROPOSAL • BOARD REVIEW

Forward Deployed Engineering

The onshore tip of the spear for AuthenticAI™ delivery

A charter to stand up StatusNeo's FDE practice — and a 30/60/90 plan to prove it.

Jithendran (Jeeth) Sellamuthu

Head of Forward Deployed Engineering (proposed)

Prepared for the Founder & Board sponsor • June 2026

StatusNeo has the frameworks and the scale.

What it does not yet name is the onshore, customer-embedded delivery motion.

WHAT STATUSNEO HAS BUILT

- AuthenticAI™ Loop — Clarity → Build → Velocity → Improvement
- Enterprise OS Fabric™ — six fabrics (Dev, Data, Ops, Security, Experience, Decision)
- AI-Native SDLC + AI Maturity Index + AI Agents Library
- GCC Setup & Scale — offshore-concentrated, SV-disciplined
- Sharp 2026 POV — Context is the Moat, Agent-Washing, Agentic Blueprint

THE ONE THING MISSING

Forward Deployed Engineering

- Lands the OS Fabric™ inside the customer — not just in a GCC
- De-risks the offshore handoff — the #1 GCC failure mode
- Unlocks regulated, air-gapped buyers — healthcare, BFSI, defense
- Tip of the spear for land-and-expand — FDE opens, GCC scales

StatusNeo has the frameworks and the offshore scale.

FDE is the missing onshore tip of the spear

that lands those frameworks inside the customer, de-risks the handoff, and unlocks the regulated enterprises your air-gapped posture is already built for.

“And I just proved it live for your customer Modutecture — the CTO was enthusiastic and invited me deeper.”

28 years of the exact motion this practice needs.

28 yrs FDE-equivalent

Embedded-at-customer from HCL-HP → Qualcomm (40M users, 99.999%, US Patent) → GE Healthcare → Mitchell → Amazon → Stealth GenAI.

Regulated-domain native

Healthcare, financial, safety-critical — exactly StatusNeo's air-gapped target verticals (healthcare/BFSI/defense).

AI-native architect

Governed agentic AI: the model proposes, a deterministic gate disposes. AuthenticAI™ 'responsible, not reckless' in running code.

Live proof — Modutecture

Just delivered a working, customer-validated FDE engagement for your customer. The CTO wants more. That's the pilot for this practice.

FDE lands. GCC scales. One pod, no handoffs.

FDE — ONSHORE

Embedded, senior, customer-trusted.
Diagnoses, architects, lands a working slice
on the customer's stack.

THE SEAM

The FDE stays single owner of the outcome.
Pulls the offshore pod in behind earned trust
— no handoff gap.

GCC — OFFSHORE

Velocity + cost. Scales delivery behind the
trusted relationship using the Agents Library
+ AI-Native SDLC.

FDE = onshore trust + architecture authority. GCC = offshore velocity + cost. Two halves of one motion.

From one validated pilot to a named, scaling practice.

DAYS 0-30

LISTEN, MAP, LAND

- Immersion: sponsor, CEO, CTO, regional heads
- Audit accounts → 3-5 FDE targets
- Formalize Modutecture as pilot #0
- Draft & sign the FDE Charter v1

DAYS 31-60

CODIFY & PROVE

- Document the FDE Loop™ (cookbook)
- Build the Landing Runbook
- Identify/onboard first 2-3 FDEs
- Land a second account

DAYS 61-90

SCALE & INSTITUTIONALIZE

- Productize 'StatusNeo FDE' as a practice
- Practice dashboard + pipeline
- Co-sell enablement across regions
- Whitepaper: The Embedded Edge

The FDE drives adoption — measured, not asserted.

In an 80:20 agentic model, deploying software is easy; breaking organizational inertia is the job. The Pod Commander is graded on how deeply the client adopts the methodology.

TTFV

< 14 days

to first tested binary in staging

Client-Authored Specs

> 60%

of Gherkin files by month 2

Agentic PR Merge Rate

> 90%

merged with no human rewrites

Human Intervention

< 2 / 1k LOC

manual commits to agent code

Platform Contribution

≥ 2 / pilot

components pushed Spoke → Hub

System Adoption

> 75%

weekly active of trained operators

The crossover that proves it: *when the client stops micromanaging the code and starts authoring the specifications.*

Five reasons this is mine to build.

1

I am the proof, not the pitch. Ran the embedded FDE motion live for your own customer (Modutecture). No one else can say that today.

2

I unlock your hardest segment. Healthcare / BFSI / defense don't buy pure offshore — they demand embedded, regulated-domain engineers. My whole career.

3

I make the OS Fabric™ landable. The framework is excellent; FDE is how it gets deployed and trusted inside a customer, not just architected in a deck.

4

I solve the GCC handoff problem. The #1 failure mode of offshore-led delivery — solved by the onshore tip of the spear that opens accounts the GCC scales.

5

AuthenticAI™ in running code. 'Responsible, not reckless / business-driven, not demo-driven' is governed agentic AI. I build that. FDE makes it real.

THE ASK

Give me the charter — and 90 days.

The charter to stand up StatusNeo's Forward Deployed Engineering practice — starting with the Modutecture pilot already in flight — and 90 days to prove it becomes a named, scaling, regulated-enterprise-unlocking practice line.

Day 30

Charter signed · pilot live

Day 60

Methodology + 2nd account

Day 90

Named practice · pipeline · co-sell
